

ITP JS

Week 1

Practice Tasks

1. Mention 10 usage of JavaScript in client side. No 1 is done for you
 - Calculating total amount of bill when user adds new item to his shopping cart(Complete the rest 9 examples)
2. In your HW document, integrate a very basic JavaScript. It should show an alert window when the page loads. The alert should contain your name inside it
3. What is the difference between **margin** and **padding**? Demonstrate margin and padding by using bordered boxes and background colors.
4. Instead of using CSS, try to resize your resume photo by just using HTML.
5. In your resume, add links of your social websites (facebook, github etc) using HTML anchor tags
6. Using HTML and CSS, design a very simple login form. The form should take email and password as input. You don't have to use any CSS positioning or complex CSS attributes (like float, flexbox etc). So, the form will be linear and straight vertical. *The idea is to introduce students with the Form tag and its usage.* The final goal would be to create a form that doesn't look like the default. For this, you have to apply styling to your input fields and buttons. The styles might include things like box-shadow, border, background-color etc.
