

ITP JS HW

Week 8

1. What are the differences between Babel and Webpack? Are they complementary to each other?
2. Create a simple shop system where there are several users. Each user has a cart of their own. Users should be able to place order and retrieve order history. You have to demonstrate code splitting here. For simplicity, you can avoid using WebPack and just use the new `type="module"` feature (supported in Chrome 65+)

HINT: You need to create two classes - User and Cart. These two classes should be in separate files.
